

**IN THE CLAIMS:**

Please amend claims 26-32, 34-41, 46, and 47 as indicated below.

1           26. (Amended) A system for communicating with a plurality  
2 of remote locations from a central station utilizing dial-up  
3 telephone facilities comprising:

4           television communication structures located at said  
5 plurality of remote locations for telephonically providing  
6 representative image television signals of said plurality of  
7 remote locations and for telephonically receiving and  
8 sending audio signals to carry voice;

9           a plurality of television display structures, including  
10 speaker phones, located at said central station for  
11 receiving telephonic signals and displaying said [scene]  
12 representative image television signals of said plurality of  
13 remote locations;

14           telephonic interface apparatus for interconnecting said  
15 television [camera] communication structures at said  
16 plurality of said remote locations with said plurality of  
17 television display structures at said central [location]  
18 station and including at least one audio response unit at  
19 said central station; and

20           a control unit for controlling said telephonic  
21 interface apparatus to establish television and audio  
22 communication between a select television camera structure  
23 at one of said plurality of remote locations and one of said

24. plurality of television display structures at said central  
25 station, with said central station receiving a remote  
26 location display and one of said plurality of remote  
27 [station] locations receiving prompts from said at least one  
28 audio response unit for manually actuating a keypad to  
29 provide DTMF signals.

27. (Amended) A system according to claim 26 further  
including means for controlling said plurality of television  
display structures in accordance with said DTMF signals.

28. (Amended) A system according to claim 26 wherein said  
control unit includes [means] television communication structure  
for establishing television communication in response to DTMF  
signals representing a personal identification number.

29. (Amended) A system according to claim 26 wherein said  
telephonic interface apparatus includes means for providing "D"  
channel type signals and wherein said control unit establishes  
communication to a select one of said television display  
[structure] structures in accordance with said "D" channel type  
signals.

30. (Amended) A system for communicating with a plurality  
of remote locations from at least one central station utilizing  
dial-up telephone facilities, comprising:

4. television camera structures positioned at said  
5 plurality of remote locations, each of said television  
6 camera structures for providing scene representative  
7 television signals and including a speaker [phones] phone  
8 and a [keypads] keypad;

9 at least one television display structure including  
10 *at least one* speaker ~~phones~~ at said at least one central station for  
11 receiving telephonic signals and displaying said scene  
12 representative television signals;

13 telephone interface [apparatus] unit for selectively  
14 interconnecting said television camera structures and said  
15 at least one television display structure and including at  
16 least one audio response unit at said at least one central  
17 station; and

18 a control unit at said at least one central station *including a computer for automatically*  
19 controlling said telephone interface unit to provide voice  
20 prompts by said audio response unit for manual activation of  
21 a keypad to provide DTMF signals.

1 31. (Amended) A system according to claim 30 wherein said  
2 control unit controls said television display [device] structure  
3 in accordance with said DTMF signals.

1 32. (Amended) A system according to claim 31 wherein said  
2 control unit provides graphic signals to supplement said scene  
3 representative television signals in response to said DTMF

4 signals.

1 34. (Amended) A system for monitoring a plurality of  
2 scrutiny locations from a central station using dial-up telephone  
3 facilities comprising:

4 television camera structures at said plurality of  
5 scrutiny locations for providing representative dynamic  
6 image television signals representative of scenes from said  
7 plurality of scrutiny locations;

8 at least one television display structure located at  
9 said central station;

10 telephonic interface apparatus for interconnecting said  
11 television camera structures at said plurality of scrutiny  
12 locations to said at least one television display structure  
13 at said central location; and

14 a control unit at said central station including memory  
15 for storing scrutiny location call data and graphic display  
16 data, said control unit for actuating said telephonic  
17 interface apparatus to establish television communication  
18 between said central station and said plurality of scrutiny  
19 locations to provide a sequence of remote location displays  
20 at said central station showing a scene and graphic display  
21 data, said control unit further including interrupt  
22 structure for receiving an interrupt signal manifesting a  
23 predetermined circumstance to interrupt said sequence and to  
24 provide an alternate display of a scene from one of said

25. plurality of scrutiny locations along with graphic display  
26 data.

1 35. (Amended) A system according to claim 34 further  
2 including sensor units at said plurality of scrutiny locations  
3 for providing said interrupt signal to said control unit.

Ad Conf.  
1 36. (Amended) A system according to claim 34 wherein said  
2 control unit includes means for providing graphic displays on  
3 said remote location displays.

1 37. (Amended) A system according to claim 34 further  
2 including operator control structure at said central station to  
3 provide said interrupt signal.

1 38. (Amended) A system according to claim 34 wherein said  
2 television camera structures for at least one of said plurality  
3 of [security] scrutiny locations includes a processor for  
4 interfacing said control unit at said central station to control  
5 said television communication between said central station and  
6 said one of said plurality of scrutiny [location] locations.

1 39. (Amended) A system according to claim 38 wherein  
2 [said] a television camera structure for said one of said  
3 plurality of scrutiny [location] locations includes a plurality  
4 of sensor units located at said one of said plurality of scrutiny

5. locations for providing interrupt signals to said control unit.

Sub G<sup>2</sup> 40. (Amended) A system for observing a plurality of  
2 monitored locations from a central station utilizing dial-up  
3 telephone facilities comprising:

C<sup>2</sup> 4 at least one television camera structure located at  
5 each of said plurality of monitored locations for providing  
6 scene representative dynamic image television signals [for]  
7 of location displays;

8 a plurality of switch structures at each of said  
9 plurality of monitored locations for providing alert signals  
10 indicating various alert situations;

11 at least one television display structure at said  
12 central station for providing a scene display represented by  
13 said scene representative dynamic image television signals;

14 telephonic interface apparatus for interconnecting said  
15 television camera structures at said monitored locations and  
16 said central station, said telephonic interface apparatus  
17 including at least one autodialer apparatus at said  
18 monitored locations for dial-up connection originated from a  
19 monitored location, said telephonic apparatus further  
20 including "D" channel type apparatus, for providing "D"  
21 channel type signals to manifest said alert situations; and

22 a control computer activated by said "D" channel type  
23 signals and including memory structure addressable to supply  
24 location graphic data, including an alert situation

Sub G-2  
25 indication for actuating said at least one television  
26 display structure to display the graphic data including an  
27 alert situation indication along with said scene  
28 representative dynamic image signals of said location  
29 displays.

BOARD REVISION  
1 41. (Amended) A system according to claim 40 wherein said  
2 memory structure is addressed by a monitored location telephone  
3 number as indicated by ANI signals automatically provided by said  
4 dial-up telephone facilities to provide graphic data relating to  
5 identification.

Sub D2  
1 46. (Amended) A system for communicating with a plurality  
2 of remote locations from a central station utilizing dial-up  
3 telephone facilities comprising:

4 television communication structures at said plurality  
5 of remote locations for telephonically providing  
6 representative image television signals and for  
7 telephonically receiving and sending audio signals to carry  
8 voice;

9 a plurality of television display structures at said  
10 central station for providing a display from said  
11 representative image television signals for providing and  
12 manifesting audio signals;

13 telephonic interface apparatus for interconnecting said  
14 television communication structures at said plurality of
